Canada

Canada

# Current Situation

## NAD83(CSRS) v.7, epoch 2010

- *Tied to ITRF*
- *Fully dynamic since ~ 2006 (Euler pole, velocity model)*

### Issues:

- ▣ *Euler pole residual*
- ▣ *Epoch transformations for coordinates only (not widely available for data layers and databases)*
- ▣ *Many adopted versions and epochs (TBD)*
- ▣ ***After 2025: 1.5 meter discrepancy with NATRF2022 at the Canada-US border***

# Current Situation

## CGVD2013

- Replaced CGVD28 (2015)
- Realized with a geoid model (CGG2013a)
- Definition of sea level ( $W_0$ ) agreed upon with NGS in 2012
- Canadian Council of Geomatics Resolutions 2011 & 2013

## Issues:

- Improved geoid models available
- Not adopted by all provinces, some in the process (TBD)
- Current realization is different than the planned realization of NAPGD2022

# Plans and Timelines

**NRCan will adopt NATRF2022 in 2025, in parallel with the US**

- *Improved definition*
- *Alignment with the US*
- *Opportunity to unify reference frames in Canada*

Natural Resources  
Canada

Ressources naturelles  
Canada

Canada

# Plans and Timelines

**NRCan will issue a new realization of CGVD2013 in parallel with the US adoption of NAPGD2022**

- ▣ *Improved geoid model*
- ▣ *New geoid model will be common or compatible with the one realizing NAPGD2022*
- ▣ *Both geoid-based height systems in the same OGC standard format (GGXF)*

Realization with a common NA geoid model:  
difference between NGS and CGS experimental  
geoids

# Plans and Timelines

Discussion with provinces since ~2018

- CGRSC: Canadian Geodetic Reference System Committee (Provinces, OGDs, NGS)

## CCOG: Canadian Council of Geomatics Resolution, October 2022

### F22-0X Reference System Modernization

**Whereas** the United States plans to adopt new reference frames (NATRF2022<sup>1</sup> and NAPGD2022<sup>2</sup>) in 2025 and Natural Resources Canada (NRCan) is collaborating with U.S. officials to ensure compatibility at the international border, and;

**Whereas** CCOG subcommittees, the CGRSC and the Cadastral Forum, confirm a willingness to adopt NATRF2022 as a unified geometric reference frame within Canada, and;

**Whereas** the new US height system (NAPGD2022) will be compatible with the existing Canadian height system (CGVD2013<sup>3</sup>), and;

**Whereas** NRCan will work to ensure that tools are available for CGRSC and Cadastral Forum members and their stakeholders to update data sets as part of migration towards NATRF2022, and;

**Whereas** migration to new datums is expected to take several years, and capacity to perform the migration will require new or additional resources in many jurisdictions;

**Be it resolved that** the CCOG accepts and endorses these measures and encourages all Provincial jurisdictions to promote and facilitate preparation for the adoption of unified reference frames for Canada.

### F22-0X Modernisation des systèmes de référence

**Attendu que** les États-Unis prévoient d'adopter des nouveaux cadres de référence (NATRF2022<sup>1</sup> et NAPGD2022<sup>2</sup>) en 2025 et que Ressources naturelles Canada (RNC) collabore avec les autorités américaines pour assurer la compatibilité à la frontière internationale;

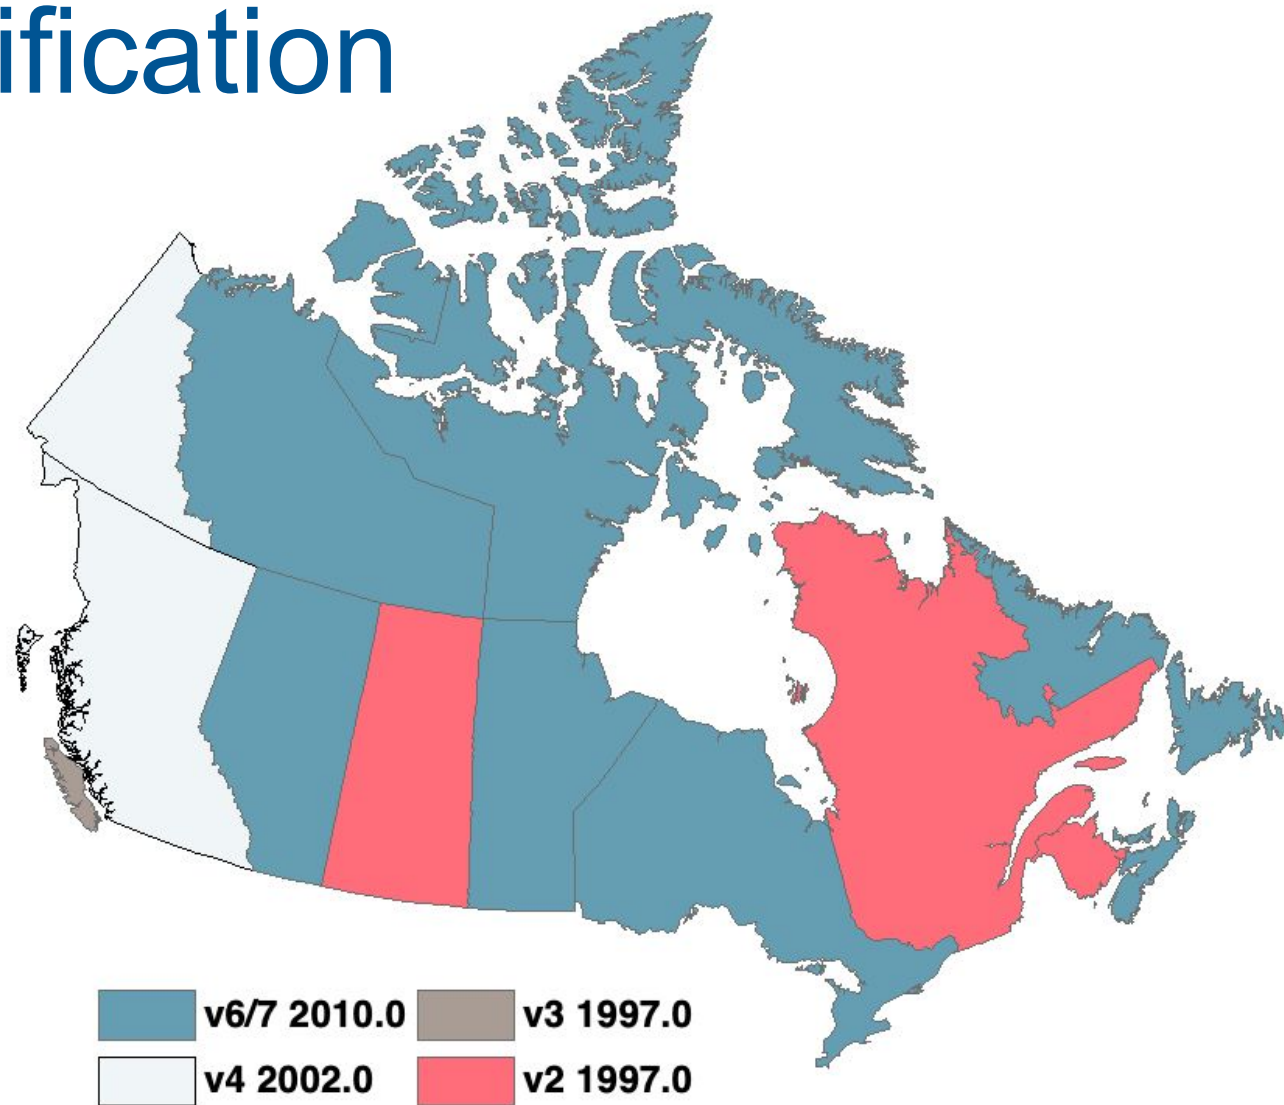

**Attendu que** les sous-comités du COCG, le CCSRG et du Forum Cadastral, confirment la volonté d'adopter NATRF2022 en tant que cadre de référence géométrique unifié au Canada;

**Attendu que** le nouveau système altimétrique des États-Unis (NAPGD2022) sera compatible avec le système altimétrique Canadien existant (CGVD2013<sup>3</sup>)\*:

# Reference Frame Unification

Stakeholder input (regulatory dependencies survey, closing December 15):

*'We have already updated to NAD83(CSRS) CGVD2013. It took months & significant effort on our part & our partners at the Province ... to 1) validate our method 2) to migrate our GIS holdings from ATS77, CGVD28... We also logged a ticket with \*\*\* to incorporate WKID\* 8083 into their software so we could stop using a custom coordinate system which allowed for proper projection on-the-fly by the software and \*\*\* business partner applications. This was probably a year in process. Once incorporated into \*\*\*'s software we had to migrate our GIS data again to WKID 8083, from the custom coordinate system even though they were the same spatial location. This was a matter of making the software aware this was a recognized defined coordinate system.'*

*\*WKID ID 8083*

# Reference Frame Unification

- Importance of the connection between geospatial software and geodetic registries
- Years of planning and effort for migration
- Jurisdictions need to know what tools they will have at their disposal

Natural Resources  
Canada

Ressources naturelles  
Canada

Canada

# What we are telling our stakeholders

- CGS will adopt NATRF2022 and a new realization of CGVD2013 in parallel with the US.
- maintaining several systems as other jurisdictions migrate
- Core products will be available and implemented in CGS Tools for 2025
  - coordinate transformations
- ***We are working with geospatial software developers to ensure the availability of tools for data layer transformations***

# Thank you!

## Questions?

**NATRF2022**

Natural Resources  
Canada

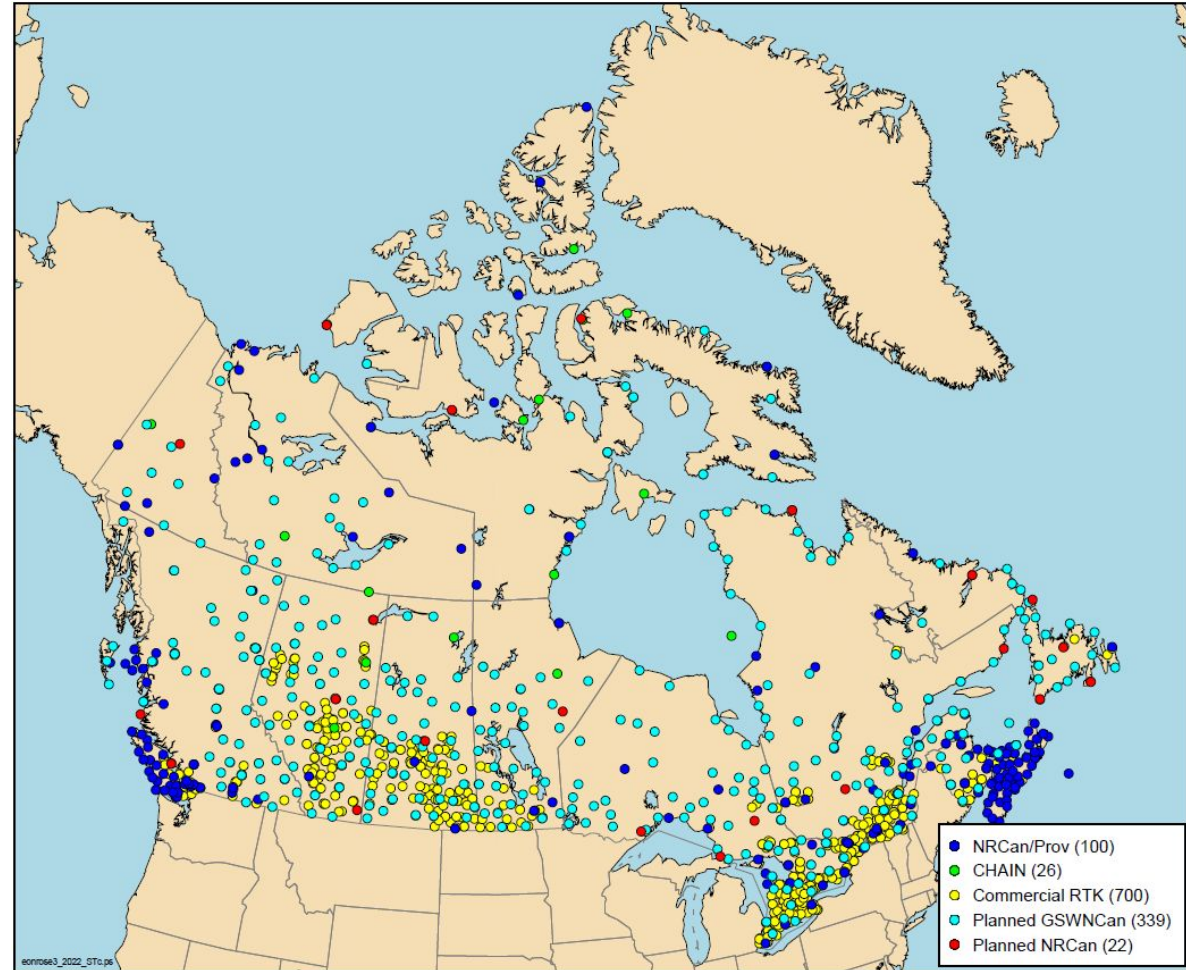

Ressources naturelles  
Canada

Canada

# Limitations of existing geodetic services

## Public and Commercial RTK services

- Located primarily in the populated areas
- Commercial providers networks are not always compatible with each other or require multiple subscriptions

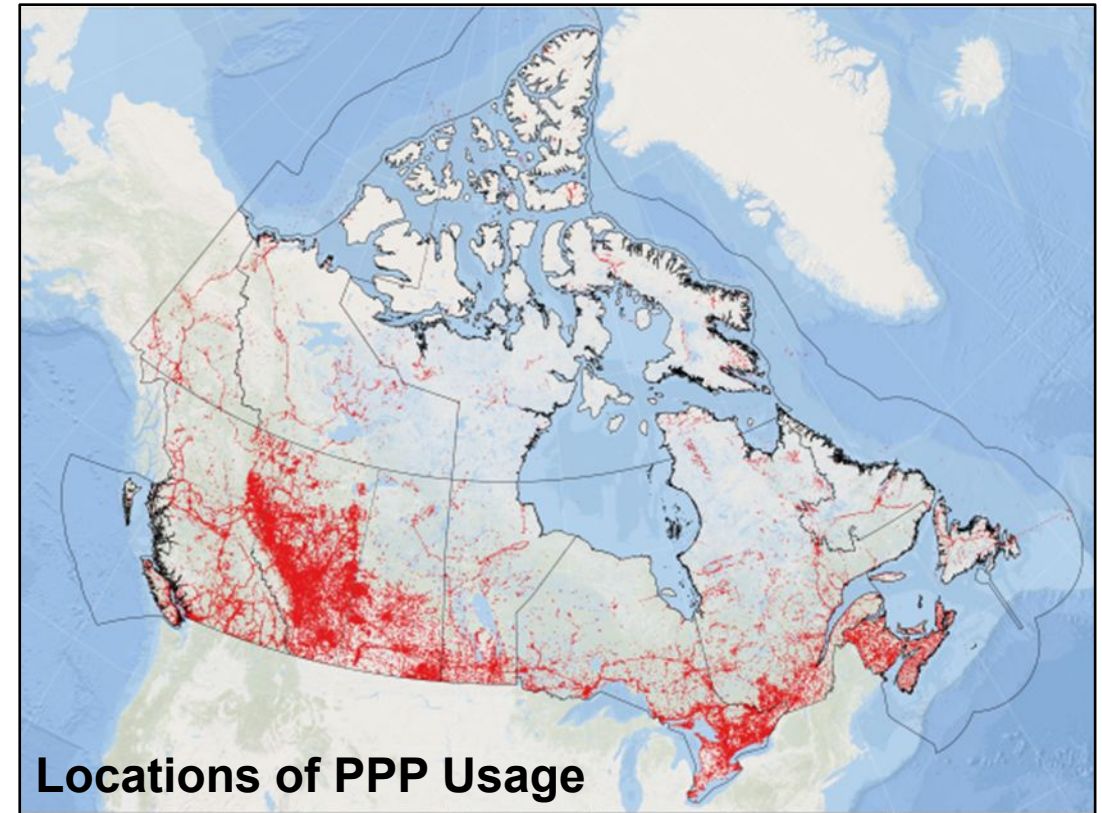

Current and planned locations of active control stations in Canada

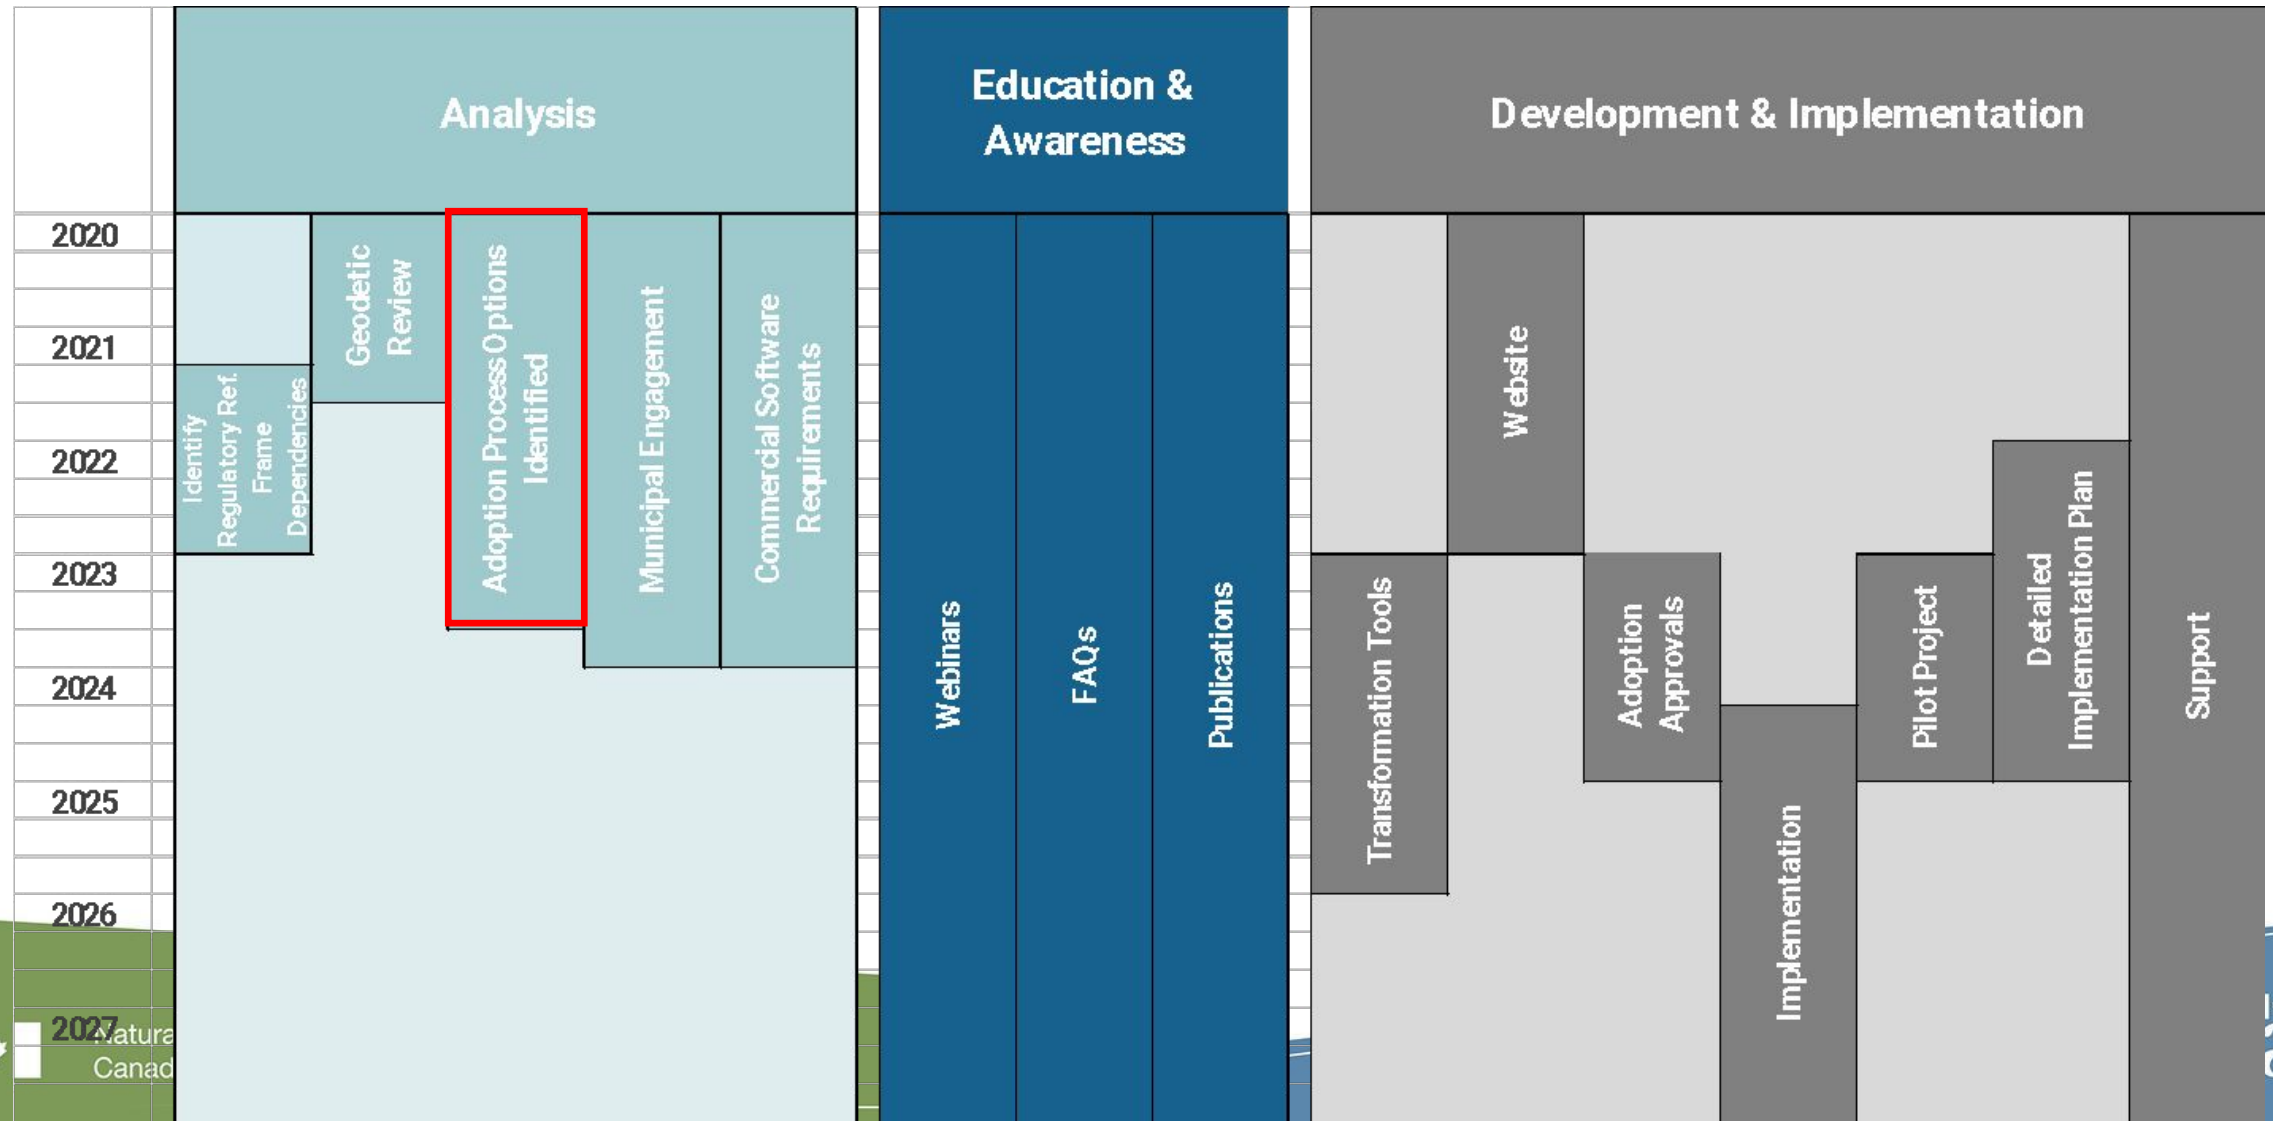

# CGS Tools: CSRS-PPP

- Precise Point Positioning (PPP) uses precise orbits in current ITRF
- Results at epoch of data
- Need to transform to NAD83(CSRS) & propagate to desired epoch – done by CSRS-PPP
- CSRS-PPP used extensively, esp. in remote areas
- Doesn't provide a direct tie to local control which is a requirement in some jurisdictions – will see differences shown in previous maps

# URF Task Team Roadmap

# CGS Tools: NTV2

- NAD27 includes distortions
- NTV2 is a tool to apply a distortion model in grid format.
- NTV2 grid to transform from NAD27 to NAD83, or other legacy to modern systems.

    - ▢ standardized way of representing the deformation model

☰ README.md

## GGXF : Gridded Geodetic data eXchange Format

The purpose of the Gridded Geodetic Data Exchange Format (GGXF) project team is to design a file structure and computer storage mechanism for the efficient exchange of regularly gridded geodetic data. There are several open issues that need to be refined in an open collaborative environment. This will be achieved by:

- Defining what is meant by "gridded geodetic data"
- Establishing the use case(s) for the GGXF
- Defining the user needs for a GGXF
- Defining the requirements of a GGXF
- Evaluating existing grid formats used for the exchange of geodetic data
- Determining the deficiencies of existing grid formats
- Designing the grid structure
- Designing the header structure
- Designing the GGXF file structure
- Develop a strategy for encoding the file
- Develop a strategy for promulgating the format as a standard for the geodetic community

The work will be conducted under the auspices of the OGC CRS DWG. The GGXF format is intended to support geodetic gridded data used in coordinate transformations including deformation models. This team is working in close collaboration with the CRS DWG project team developing the "Deformation Functional Model" (DFM) that is specifying these requirements. On completion of the work, a Standards Working Group shall be chartered and materials passed over to the SWG for finalising into a Standard.

Draft version of GGXF available on GitHub

- ISO Geodetic Registry

## ISO Geodetic Registry (ISOGR)

The ISO Geodetic Registry is a structured database of coordinate reference systems (CRS) and transformations that is accessible through this online registry system. The Register includes only systems and transformations of international application. It does not include all possible coordinate reference systems and transformations.

This Registry is provided under the auspices of [ISO Technical Committee 211](#) on geographic information/geomatics and conforms to the following ISO standards:

- [ISO 19111:2007](#) (Spatial referencing by coordinates)
- [ISO 19127:2019](#) (Geodetic register)
- [ISO 19135-1:2015](#) (Procedures for item registration -- Part 1: Fundamentals)

Work is also underway to upgrade the Registry to conform to the recently revised ISO 19111:2019 standard, which includes support for dynamic datums and geoid-based datums.

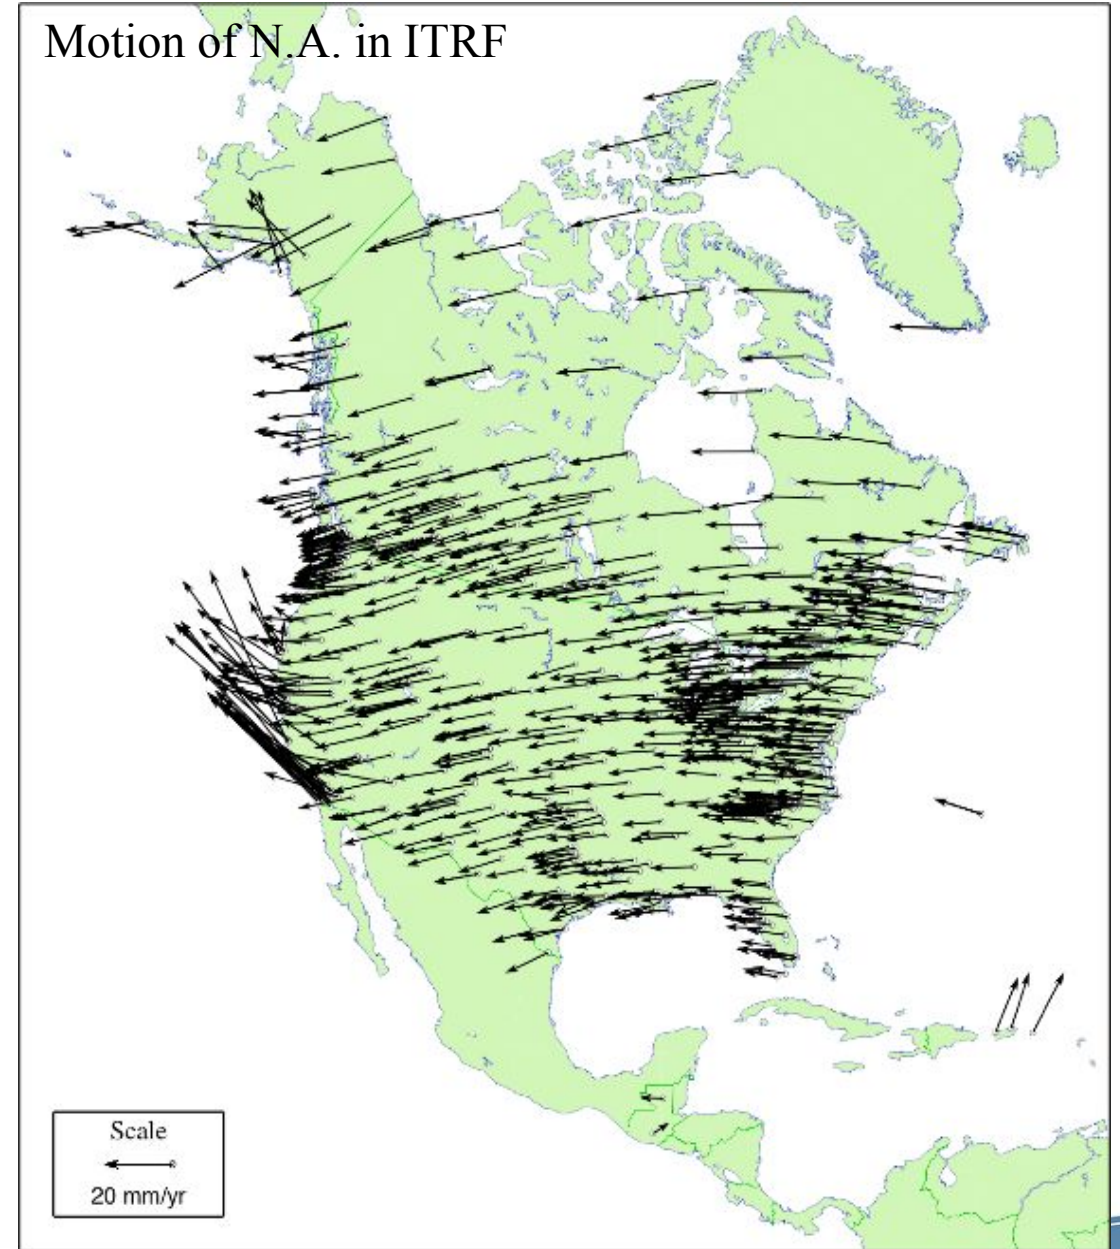

**July 2022:** ISO/TC 211, OGC and IOGP have jointly published the "[Guide to Coordinate Reference System \(CRS\) Resources](#)". The guide describes basic information and the intended purposes of the three authoritative CRS registers: EPSG, ISO Geodetic and OGC CRS registries, for the user community.

# Products
